ARC TUNER COMPONENT CAR STEREO CASSETTE DECK WITH AM/FM ELECTRONIC TUNER

ARC TUNER COMPONENT CAR STEREO CASSETTE DECK WITH LW/MW/FM ELECTRONIC TUNER

SERVICE MANUAL

Subject:
For Cassette Mechanism, refer to the Service Manual of unit number CX-100A/H

SPECIFICATIONS

General

Power source .... DC 13.8V (11 ~ 16V allowable)
Grounding system .... Negative type
Tone controls .... Bass: ±10 dB (100 Hz)
Treble: ±10 dB (10 kHz)
Maximum output level .... More than 200mV
Output impedance 100Ω
Dimensions (W × H × D) .... 180 × 50 × 150 mm
Nose size (W × H × D) .... 105 × 42 × 16 mm
Shaft interval .... 130 mm
Weight .... 1.7 kg

Tape player

Tape .... Compact cassette tape (C-30 ~ C-90)
Tape speed .. 4.76 cm/sec. (+0.19 cm/sec. −0.05 cm/sec.)
Fast forward time .... Within 120 sec. for C-60
Rewind time .... Within 120 sec. for C-60
Wow & flutter .... No more than 0.13% (WRMS)
Frequency response .... 30 ~ 15,000 Hz (±3 dB)
Cross talk .... More than 46 dB
Signal-to-noise ratio .... Dolby NR IN: more than 60 dB
Dolby NR OUT: more than 52 dB

FM tuner

Frequency range .... 88 ~ 108 MHz (KEX-20)
88 ~ 104 MHz (KEX-23)
Usable sensitivity .... 13.8 dBf (1.9 μV/150Ω)
50 dB quieting sensitivity ..... 17.5 dBf (2.9 μV/150Ω, mono)
39.8 dBf (38μV/150Ω, stereo)
Signal-to-noise ratio .... 60 dB
Capture ratio .... 1.5 dB
Selectivity .... 70 dB (±400 kHz)
Image rejection .... 45 dB
IF rejection .... 80 dB
Distortion .... 0.5% (at 60 dB, 400 Hz, mono)
0.5% (at 60 dB, 1 kHz, stereo)
Frequency response .... 30 ~ 15,000 Hz (±3 dB)
Muting level .... 17.5 dBf (2.9 μV/150Ω)
Stereo separation .... 32 dB (at 60 dB, 1 kHz)

MW (AM) tuner

Frequency range .... 525 ~ 1,605 kHz
Sensitivity 30μV
Selectivity .... 25 dB (±10 kHz)
Local/distant switch effect .... 14 dB attenuation
Max. input signal (distortion 5%) .... 125 dB

LW tuner (KEX-23 only)

Frequency range .... 150 ~ 280 kHz
Sensitivity 70μV
Selectivity .... 35 dB (±10 kHz)
Local/distant switch effect .... 14 dB attenuation
Max. input signal (distortion 5%) .... 125 dB

Note:
Specifications and the disign subject to possible modification without notice due to improvements.

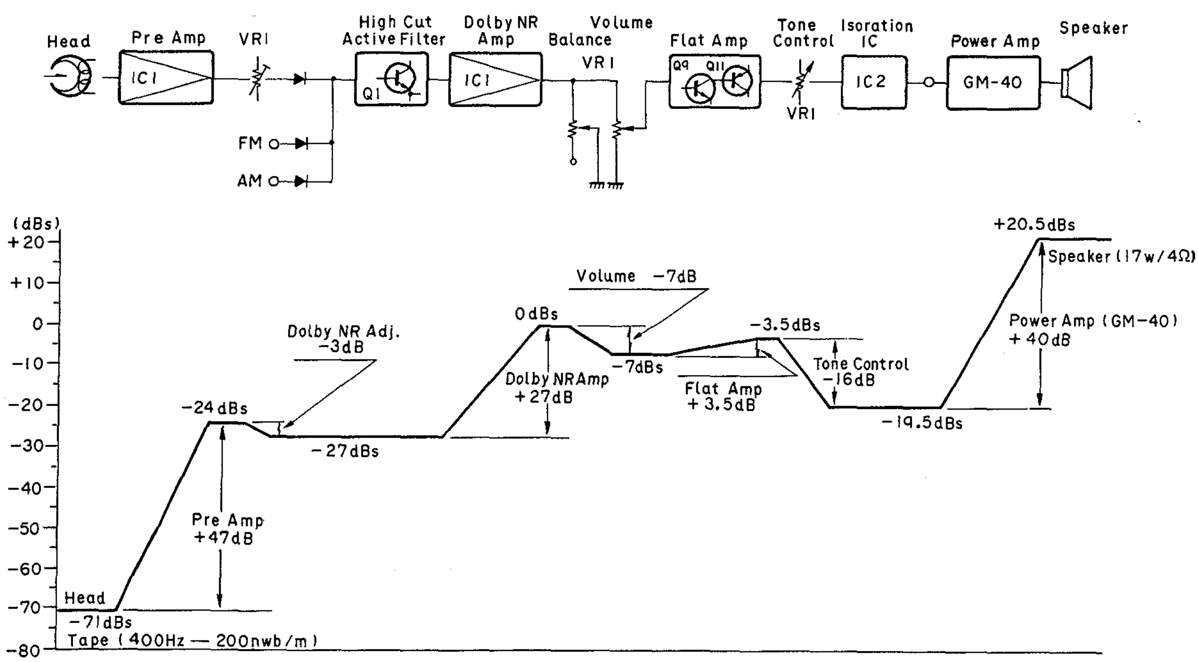

Fig. 2

• Digitally Controlled Preset Tuner

This digitally controlled circuit with frequency presetting systems consists of a voltage synthesizing circuit incorporating varactor diodes (varactors), and is designed to generate varactor control voltage, memorize tuning frequency, and digitally indicate the tuned frequency.

Turn the tuning knob left or right to feed tuning pulses to LSI (PD1002) so that the contents of the internal counter may be either reduced or increased. The output of the counter is converted through the D/A converter into DC voltage which is applied to the varactor. The tuning frequency rises or falls depending on the direction the tuning knob is turned, permitting selection of the desired stations.

To preset the tuned station, simultaneously push the station selector button and the memory button. The frequency of the selected station is thereby stored in the RAM (Random Access Memory), and pushing only the selector button will recall the frequency stored in memory to again tune the preset station.

The frequency tuned is displayed by an array of 32 LEDs. This readout is completely electronic.

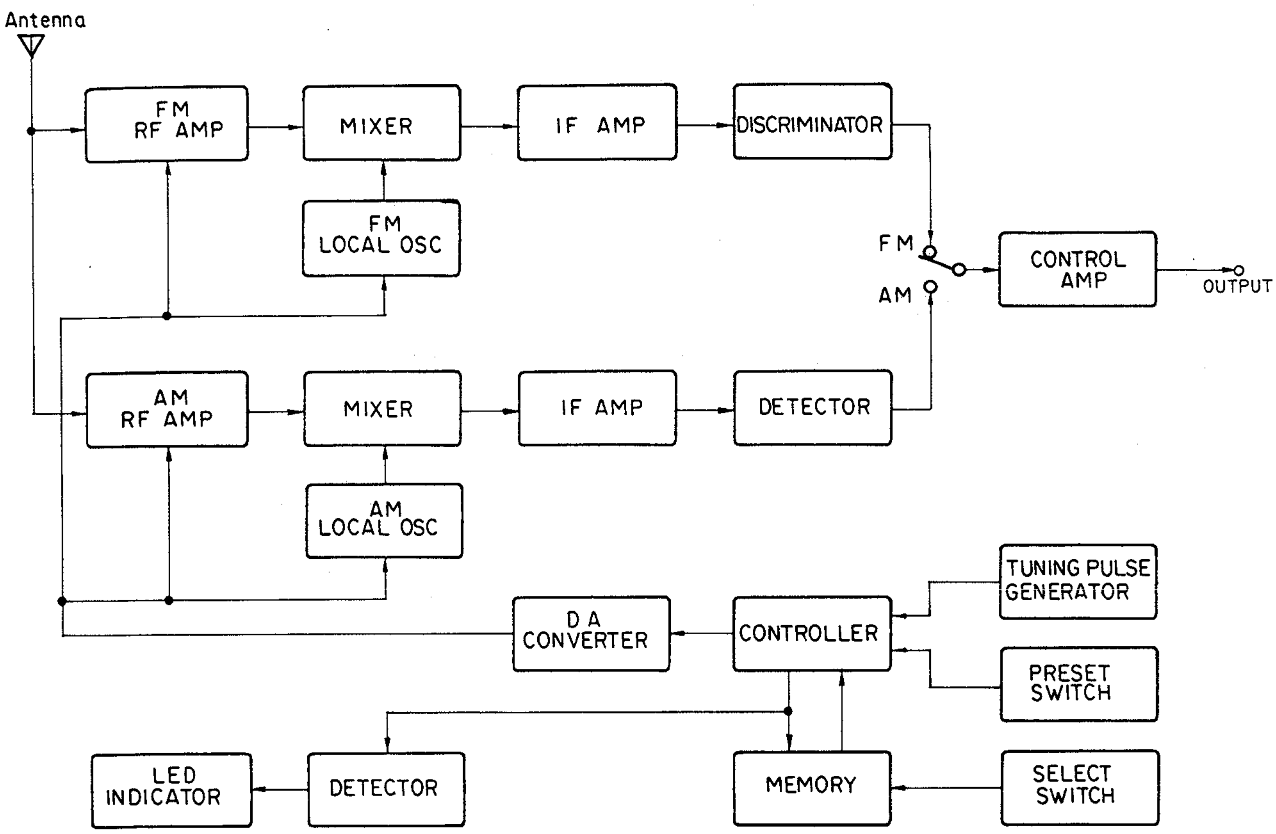

Fig. 3

• Control LSI (PD 1002)

The block diagram of LSI PD1002 is shown in Fig. 4 The essential function here is represented by the 11 bit up/down counter, the output of each bit being connected to a D/A converter in order to generate a DC voltage corresponding to the contents of the counter. The contents of this counter is variable by means of applying externally generated tuning pulses so that the desired voltage output level can be obtained. Each bit, moreover, is connected with the RAM (Random Access Memory) so that the output voltage of the tuned frequency can be stored in order that station presetting can be performed. This process is via digital signals. And, of course, this stored information can be recalled instantly to the counter to allow tuning of the memorized preset station frequency.

Because semiconductor memories are volatile—that is, memory disappears with removal of supply voltage—voltage must continue to the memory portions of the circuit even with power OFF. The CMOS PD1002, however, requires extremely low levels of power: with the oscillator not in operation power consumption is only several tens μW; with the oscillator in operation the power consumption is 20mW. Therefore, with the oscillator not in operation, connection of the PD1002 poses no problem to car batteries. In other words, with the enable terminal at low levels there is no oscillation, and the terminal is designed to be at low levels with the power supply switch set to OFF.

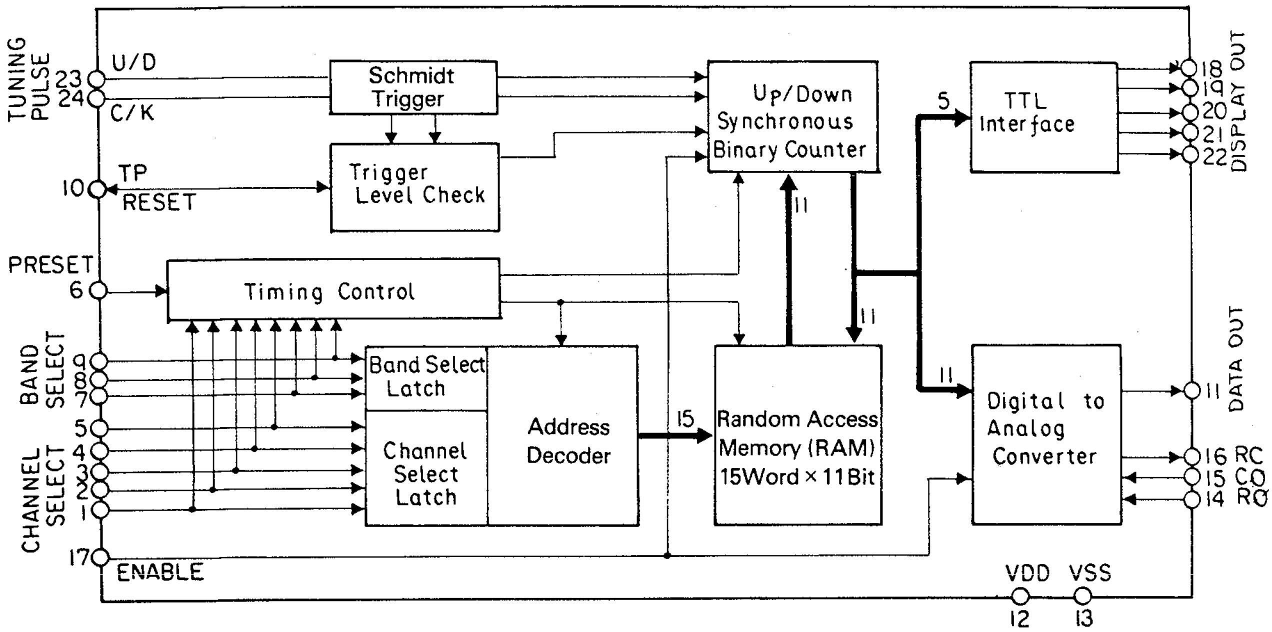

Fig. 4

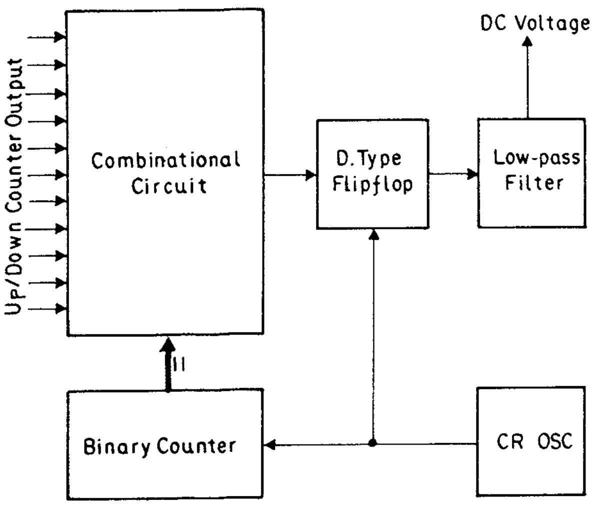

Fig. 5

• Tuning Pulse Generator

This device (basic operating principles are shown in Fig. 6) generates up/down pulses and clock pulse by turning the tuning knob. The direction the disc is turned determines whether up or down pulses are generated (see Fig. 7). These pulses determine the contents of the up/down counter.

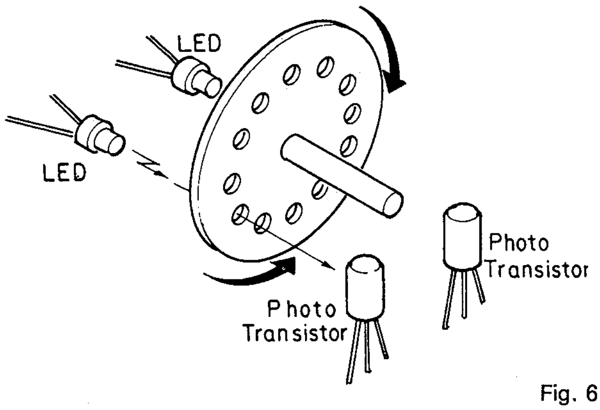

Fig. 6

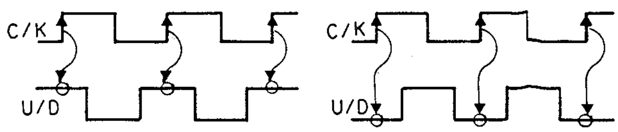

Fig. 7

• AM Tuner

The KEX-20 tuner is distinguished from the conven tional μ tuning type counterpart by the antenna input circuit. The varactor tuner of the KEX-20 is equipped with an RF Buffer in the first stage. The reason for this arrangement is the car antenna, the equivalent circuit as shown in Fig. 8. The 15 pF represents an equivalent capacitance of the antenna bar section, and the 65 pF equivalent capacitance of the cable connected to the antenna. The μ tuning type tuner is designed to make use of the combined capacitances of 15 pF and 65 pF, and 80 pF as part of the tuned circuit which requires an inductance that allows covering the entire AM band from 520 kHz to 1630 kHz with the total capacitance of 150 pF. Therefore, the capacitance variation ratio is $(1630 \div 520)^2 = 9.83$. The voltage to be applied to the varactor is in the range 1.4V to 8.4V. The standard SVC-303 provides a capacitance of 417 pF for 1.4 V and 24.48 pF for 8.4 V, and the variation ratio being 18.24. This means the band ranging from 520 kHz to 1630 kHz can be adequately covered.

The varactor, however, if used in the input circuit, will result in a capacitance variation ratio of $(417 + 80) \div (24.48 + 80) = 4.76$ with the addition of 80 pF making up the equivalent antenna circuit and allowing no more than half the required band to be covered. This is the reason an RF buffer amplifier is required to eliminate the 80 pF loading capacitance.

The varactor tuner has yet another advantage. The μ tuning type tuner requires adjustment of sensitivity when tuning in a weak signal around 1 MHz in order to prevent tracking error due to the difference in capacitance in the antenna cable. The varactor tuner eliminates this problem.

Q1 (2SK49) directly connected to the antenna is most vulnerable to surging, and D1 (ITT73N) is placed between the input terminal and ground to absorb it. ITT73N is rated at 1A per second. The input section of the FM tuner connected in parallel to the antenna input terminal incorporates a discharge element with a firing potential of less than 2 kV.

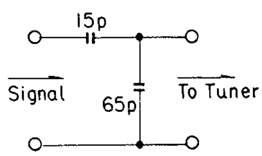

Fig. 8

• Oscillator Circuit

Fig. 9 shows the tuning voltage supply circuit and the varactor temperature compensating circuit. Adjusted for the dispersion properties of the varactor, the working voltage is made variable so as to permit adjustment of the band to be covered. E1 is a tuning variable power supply, E2 is a stabilized power supply of 8.8 V, and R1 is a resistor for the filter incorporated in the output section of the control IC (PD1002). The control IC is driven via the same voltage as E2 so that the maximum voltage of E1 is 8.8 V, and the maximum voltage to be applied to the varactor cathode, regardless of the volume position, is 8.8 V. The minimum voltage with E1 at 0 V is determined by the values of E2, R1 , R2 , and VR1; and the minimum voltage is designed to be 1.8 V with the standard varactor.

The anode side of the varactor is equipped with a temperature compensating circuit which is composed of varistors and resistors. The anode electric potential is 0.4 V, and the voltage to be applied to either end of the varactor is 1.4 V to 8.4 V. The capacitance compensating voltage to match the change in the temperature of the varactor varies with the working voltage from 1.1 mV/°C. The voltage variation of the varister MV-1 is −2mV/°C, and the anode side of the varister, will lead to overcompensation. Therefore, the variation in voltage of the varactor is divided through resistors R4 and R5 to provide a voltage change of some −1.3 mV/°C R3 , a biasing resistor for the varister, is designed to supply 3 mA.

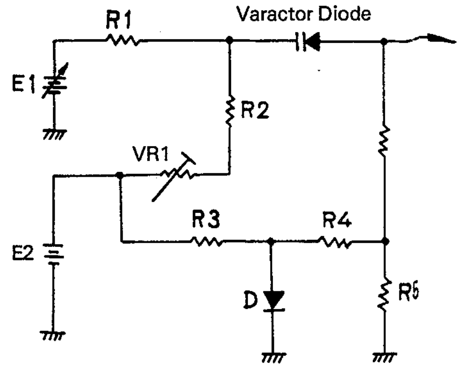

Fig. 9

• LW/MW Tuner

An LW/MW tuner should be able to tune the two bands (MW: 515 – 1,630kHz; LW: 145 – 295kHz). Therefore, the LW/MW tuner has two different types of applied voltages for the variable capacitor, high frequency circuits, and oscillator circuits which should be switched for MW and LW. For the applied voltages of the variable capacitor, the independent volumes for MW and LW are mounted on this tuner for adjusting the applied voltages, and the voltages to be applied are changed with a mechanical switch. For the high frequency circuits, the coil for MW is connected to that for LW in a series. While the MW is being tuned, the coil for LW is shortcircuited; while the LW is being tuned, the high frequency circuits are changed with a switch diode so that both the coils for MW and LW may be worked as the tuning coil for LW. For the oscillator circuits, independent oscillator circuits for MW and LW are incorporated in the tuner and are changed with a switch diode.

• Tape Selector Circuit

There are many types of cassette tapes: normal tapes, chrome tapes and the more recent metal tapes. Trends in tapes are toward an improved signal-to-noise ratio and an extended dynamic range, and even with car stereos, it has become necessary to cater to both chrome tapes and metal tapes.
When a metal or chrome tape is played back on a deck designed for normal tapes, the recording equalizer time constant is recorded not at 120μs but at 70μs, and so the sound appears higher than it actually is.
To compensate for this, a tape selector is provided to select between the normal tape position and the chrome tape position by switching the playback equalizer time constant between 120μs and 70μs.
When this switch is set to the normal tape position (tape selector is OFF), the output level falls as the frequency rises from about 50 Hz (3180μs) at −6 dB/oct, and when the frequency rises above the 1.3 kHz (120μs) level, the level becomes constant—this is the NAB curve (Fig. 10).
Usually, when playing back a normal tape, the frequency response is flat. But when a chrome tape or a metal tape is played back with this switch at the normal position, the high frequency range response rises several dB.
When the switch is set to the chrome tape position (tape selector is ON), the low-frequency range response is the same as that for the normal position but the level drops around a frequency of about 2.3 kHz (70μs) at −6 dB/oct, and once the frequency exceeds this value, the level becomes constant. When a chrome tape or a metal tape is played back, the frequency response becomes flat. When playing back a normal tape in the chrome position, the high frequency range response falls several dB.

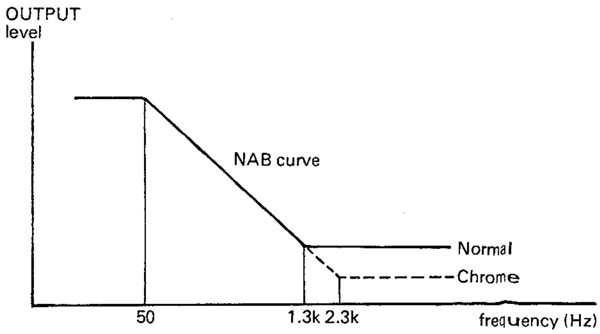

Fig. 10

• Dolby NR Circuit

Dolby NR is a method of reducing tape hiss, particularly the noise heard in the high-frequency region, and its circuit improves the signal-to-noise ratio by about 10dB. The Dolby NR circuit works as a flat amplifier during AM or FM reception and during ordinary tape playback, and it provides the Dolby NR effect when the Dolby NR switch is set to the IN position during the playback of a tape which has been recorded using the Dolby NR system.

In the case of the left channel, the signal which has passed through the D1, D3 or D5 signal selector diode passes through the 19kHz high cut filter and is amplified by Q3. The Dolby NR circuit employs IC1(HA11226) which is provided in both the left and the right channels.

When the Dolby NR switch is set to the OUT position, +B is applied as bias to the base of Q5 and Q5 goes to OFF. Since this prevents the signal from entering the high-pass filter of the Dolby NR circuit, this circuit functions as an ordinary flat amplifier.

When the Dolby NR switch is set to the IN position, +B is not supplied to Q5 and Q5 goes to ON. The high-pass filter of the Dolby NR circuit is therefore connected to the output terminals and the Dolby NR effect is provided.

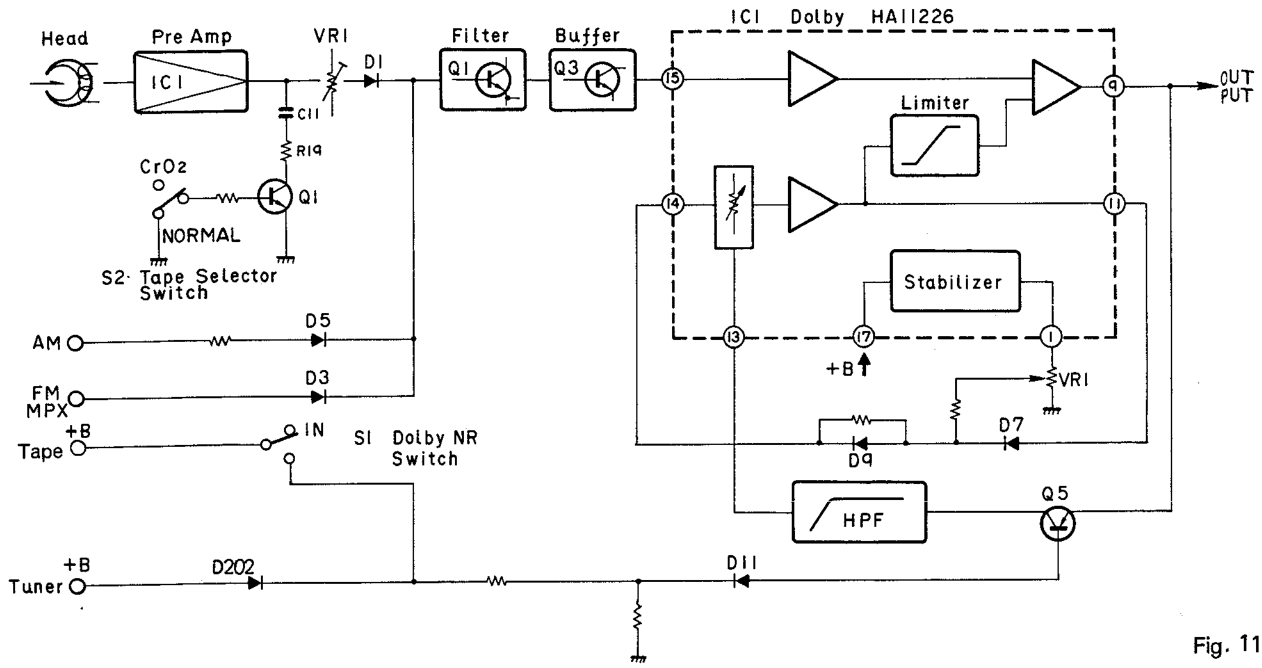

Fig. 11

• Noise Suppressor

The input signal containing the pulsive noise as illustrated in Waveform-1 is first impedance-converted by the buffer amplifier, then coupled to the gate circuit via the low-pass filter.
Meanwhile, the high-pass filter filters out only the pulsive noise component from the input signal and feeds the noise component to the noise detector where it is amplified and rectified. (See Waveform-2)
To cope with weak-signal noise, the noise detector is supported with the AGC (Automatic Gain Control) circuit. The noise component from the noise detector output is waveform-shaped by the mono-stable multivibrator (See Waveform-3). The output from the mono-stable multivibrator then couples to the gate circuit as a control-pulse array which is used to cut out only the pulsive noise component from the audio signal.
The memory provided at where holds the audiosignal level constant while the gate circuit is "closed".
The 19 kHz pilot-hold circuit serves to prevent stereo pilot-signal intermission.
The audio signal then sustains high-frequency-phase compensation to compensate for the phase shift due to the low-pass filter, then is coupled to the output terminal.

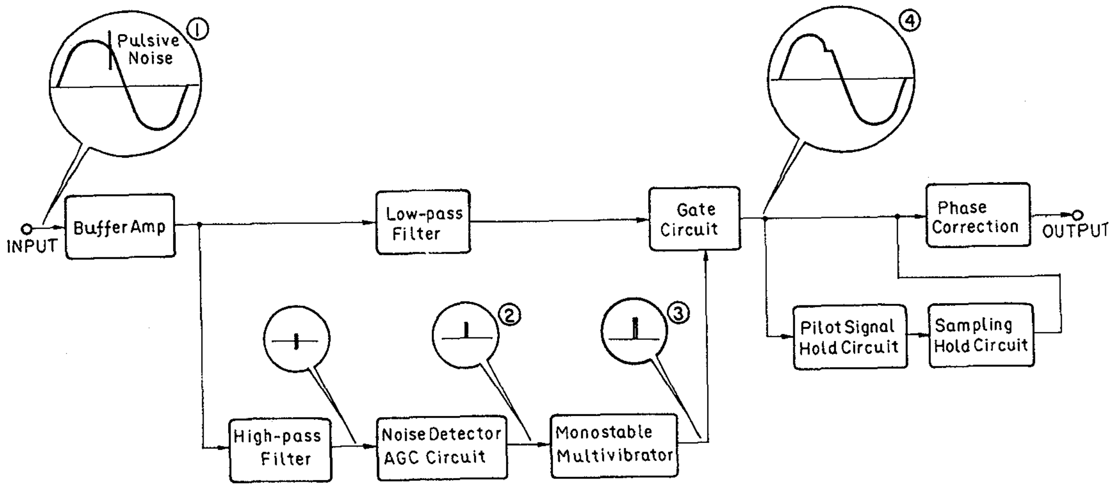

Fig. 12

3. ADJUSTMENT

3.1 FM IF ADJUSTMENT

• Connection Diagram

*Set the stereo unit for operation before making the adjustments.

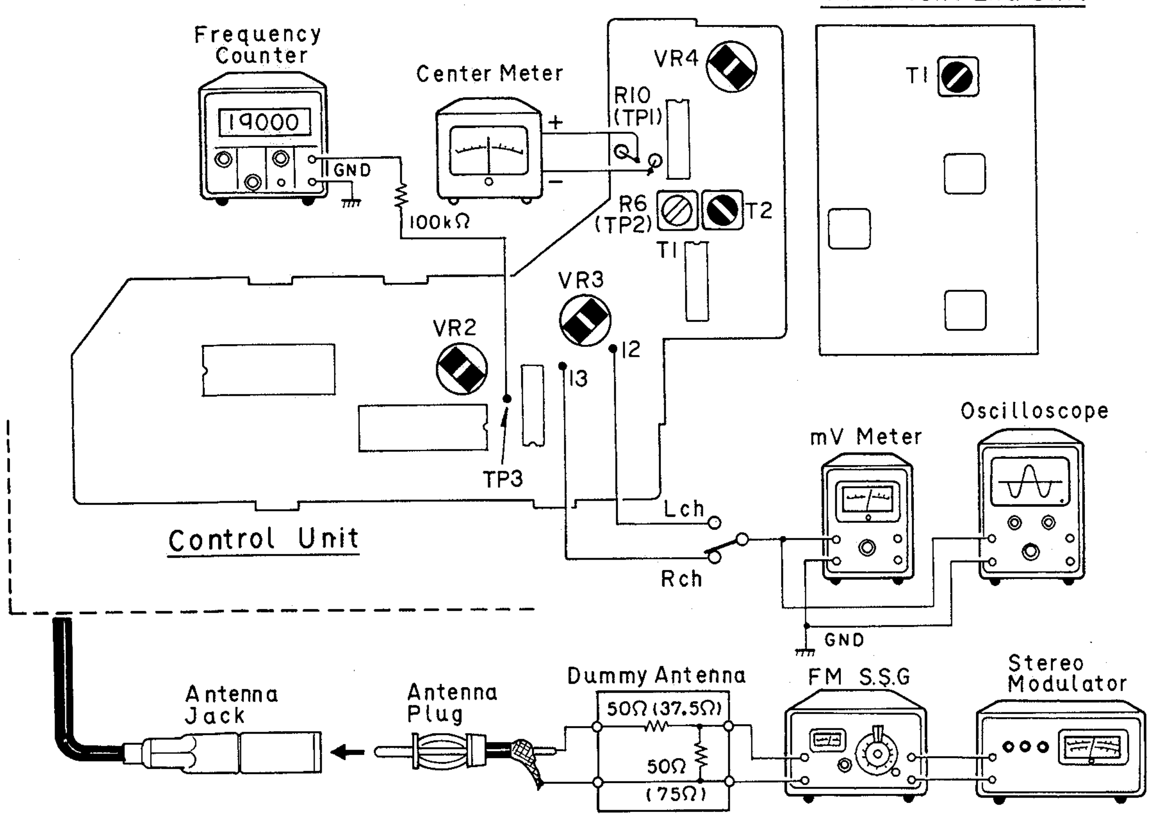

Fig. 13

• To Adjust

1. Add input signal of zero from SSG and adjust T2 so that the pointer of center meter (use one graduated for over 200μA) will come to the center.
2. Add output signal of 98 MHz 60 dB from SSG, multi-signal of modulated frequency 1 kHz of stereo modulator and tune to 98 MHz on the dial (the pointer of the center meter is at the center).
3. Adjust T1 (FM Front End Unit) so that separated signal will be minimal in its distortion factor.
4. Adjust FM IF by repeating the above procedure, steps 1, 2 and 3.

3.2 IF/MPX ADJUSTMENT

1. Shown in Fig. 13.
2. Select the band selector switch to stereo position.
3. Obtain non-modulation signal by setting SSG output at 60 dB (μV) 98 MHz. Adjust VR2 so that the frequency counter indicates 19 kHz ±30 Hz.
4. Obtain stereo modulation signal by setting SSG output at 60 dB (μV). Adjust VR3 to secure maximum separation.

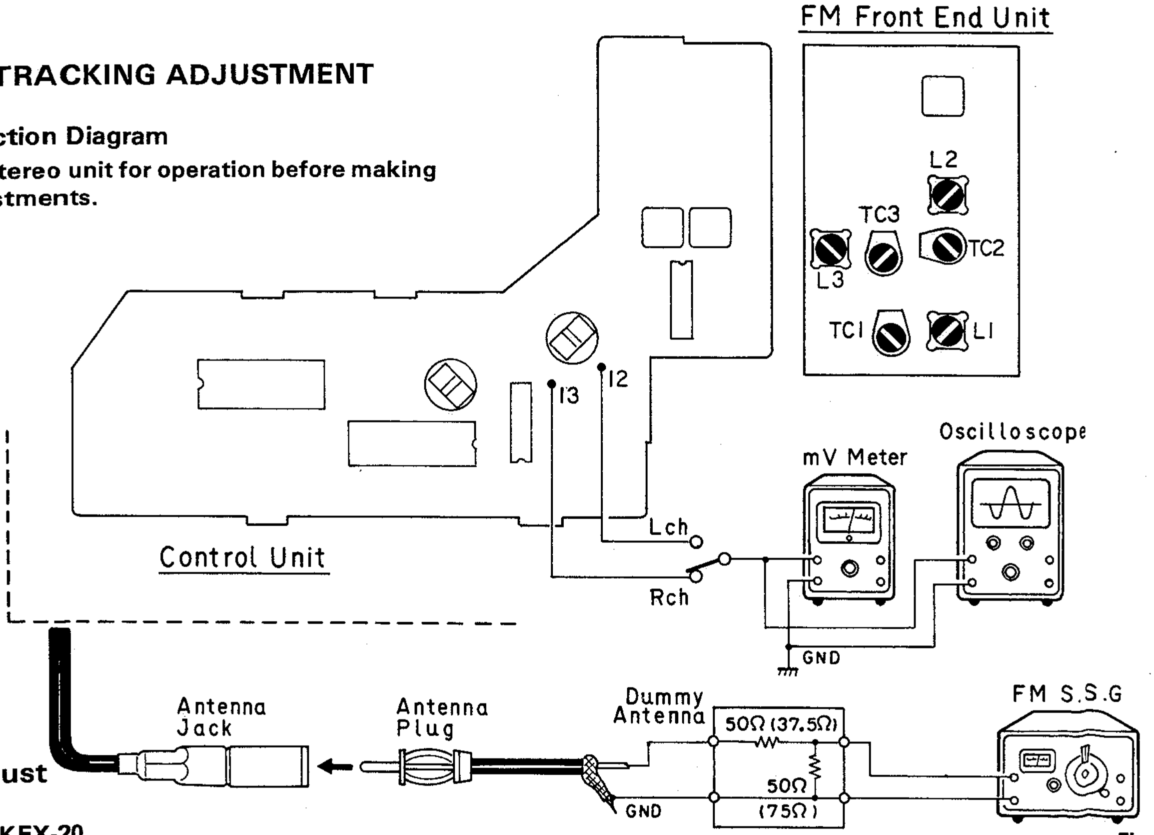
3.3 AUTO LEVEL ADJUSTMENT

1. Shown in Fig. 13.
2. Select the band selector switch to ARC position.
3. Set SSG at 98 MHz and tune using the tuning knob.
4. As SSG output gradually drops from 60 dB (μV) to low level, and SSG output reduced to 35 ±2 dB (μV), turn VR4 carefully and set it where stereo indicator is turned off.

3.4 FM TRACKING ADJUSTMENT

- **Connection Diagram**

***Set the stereo unit for operation before making the adjustments.**



- **To Adjust**

Fig. 14

In case of KEX-20

SSG Frequency	Pointer Position	Adjustment point	Note
1. 87.0 MHz (400 Hz, 100% modulation), output level 8 dB (μV)	Minimum	L3	87.0 MHz can be received
2. 108.6 MHz (400 Hz, 100% modulation), output level 8 dB (μV)	Maximum	TC3	108.6MHz can be received
3. Repeat items (1) and (2) alternately so that broadcast can be received at the frequency between 87.0 MHz and 108.6 MHz.			
4. 90 MHz (400 Hz, 100% modulation), output level 5 dB (μV)	Tuned position	L1, L2	Maximum output
5. 106 MHz (400 Hz, 100% modulation), output level 5 dB (μV)	Tuned position	TC1, TC2	Maximum output
6. Repeat items (4) and (5) alternately so that the mV meter indicates maximum output.			

In case of KEX-23

SSG Frequency	Pointer Position	Adjustment Point	Note
1. 87.0 MHz (400 Hz, 100% modulation), output level 8 dB (μV)	Minimum	L3	87.0 MHz can be received
2. 105.0 MHz (400 Hz, 100% modulation), output level 8 dB (μV)	Maximum	TC3	105.0 MHz can be received
3. Repeat items (1) and (2) alternately so that broadcast can be received at the frequency between 87.0 MHz and 105.0 MHz.			
4. 90 MHz (400 Hz, 100% modulation), output level 5 dB (μV)	Tuned position	L1, L2	Maximum output
5. 104 MHz (400 Hz, 100% modulation), output level 5 dB (μV)	Tuned position	TC1, TC2	Maximum output
6. Repeat items (4) and (5) alternately so that the mV meter indicates maximum output.			

3.5 AM IF ADJUSTMENT (KEX-20)

• Connection Diagram

***Set the stereo unit for operation before making the adjustments.**

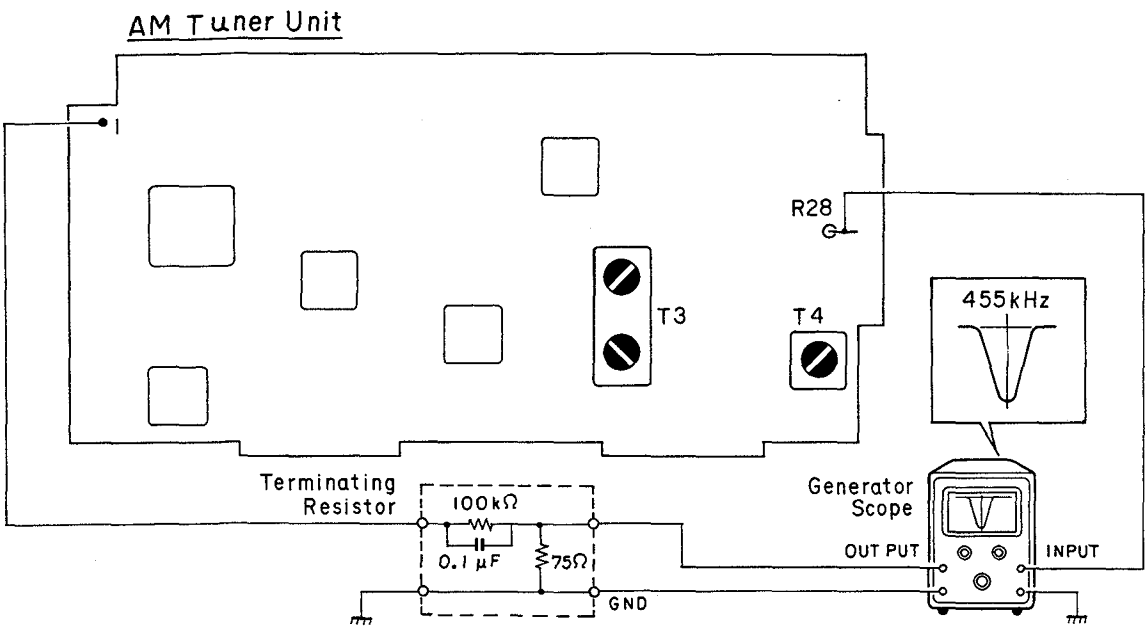


Fig. 15

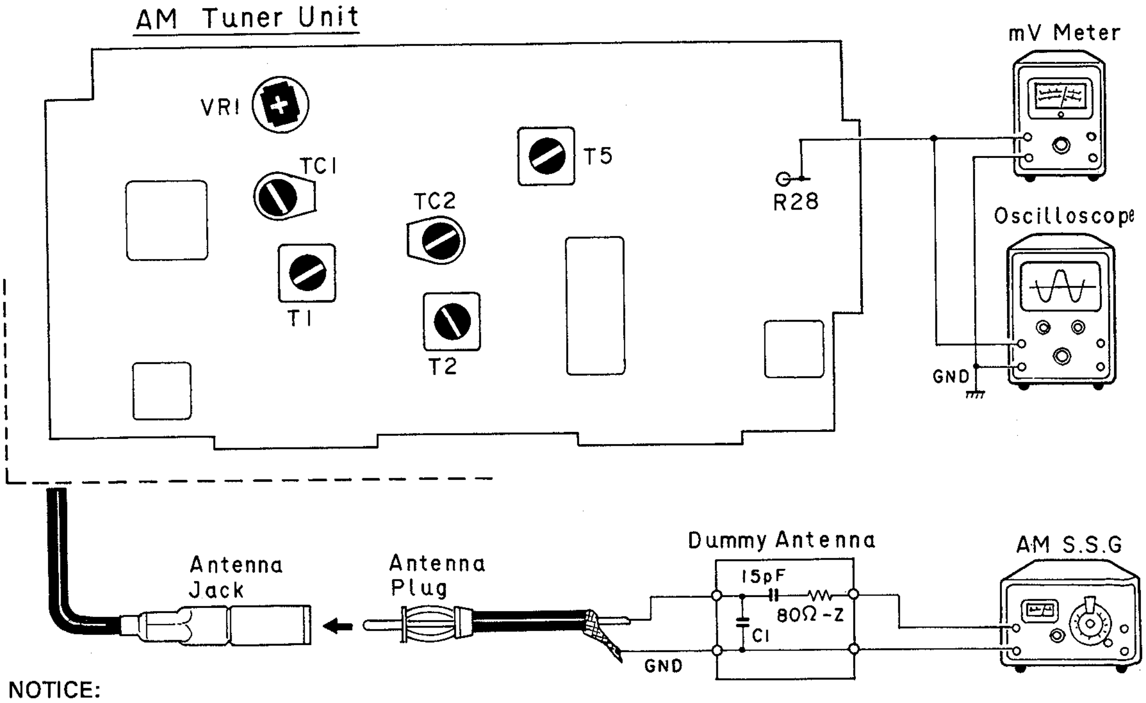
• To Adjust

1. Set Generator Scope as follows:
   Frequency centering on sweep . . . . 455 kHz
   Input level 0.3Vp-p/cm
   Output level . . . . 3mV∿10mV
2. Tune to a nearby, 1,600 kHz station.
3. Turn the cores of T3 and T4, and adjust so that U-curve will be at maximum amplitude and best symmetry.

3.6 AM TRACKING ADJUSTMENT (KEX-20)

• Connection Diagram

*Set the stereo unit for operation before making the adjustments.



NOTICE:
Select C1 so that total capacity of 80pF is attained from the direction of the receiver jack.
Z: Output impedance of the S.S.G.

Fig. 16

• To Adjust

SSG Frequency	Pointer Position	Adjustment Point	Note
1. 1,630 kHz (400 Hz, 30% modulation), output level 30 dB (μV)	Maximum	T5	1,630 kHz can be received
2. 515 kHz (400 Hz, 30% modulation), output level 30 dB (μV)	Minimum	VR1	515 kHz can be received
3. 600 kHz (400 Hz, 30% modulation), output level 30 dB (μV)	Tune to 600 kHz	T1, T2	mV meter at maximum
4. 1,400 kHz (400 Hz, 30% modulation), output level 30 dB (μV)	Tune to 1,400 kHz	TC1, TC2	mV meter at maximum
5. Repeat items (3) and (4) alternately so that the mV meter indicates maximum output.			

3.7 MW/LW IF ADJUSTMENT (KEX-23)

• Connection Diagram

***Set the stereo unit for operation before making the adjustments.**

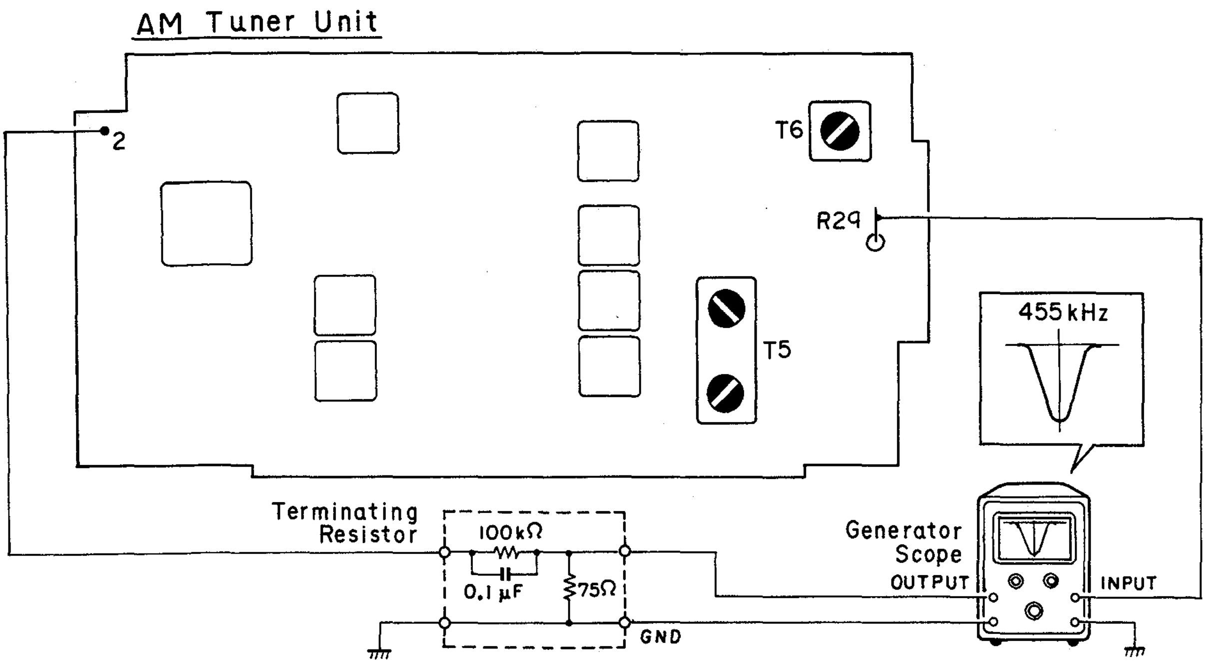


Fig. 17

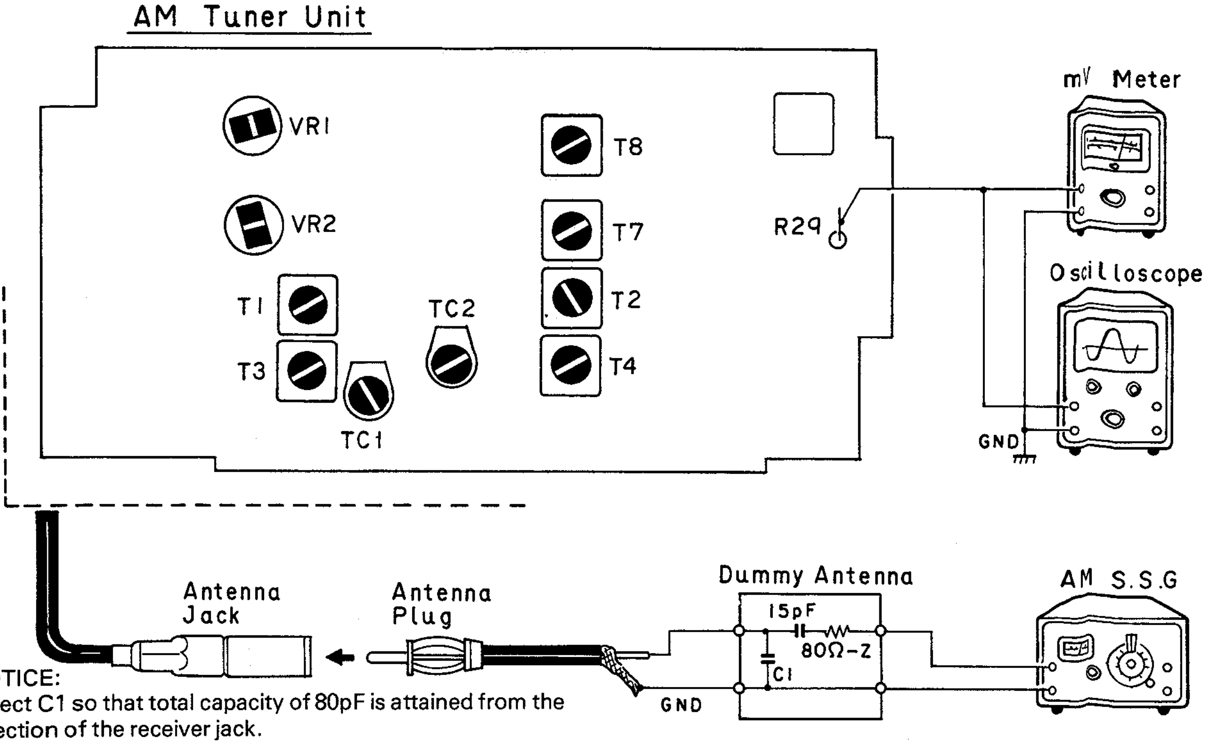
• To Adjust

1. Set Generator Scope as follows:
   Frequency centering on sweep . . . . 455 kHz
   Input level 0.3Vp-p/cm
   Output level . . . . 3mV∿10mV
2. Tune to a nearby 1,600 kHz station of MW.
3. Turn the cores of T5 and T6, and adjust so that U-curve will be at maximum amplitude and best symmetry.

3.8 MW/LW TRACKING ADJUSTMENT (KEX-23)

• Connection Diagram

***Set the stereo unit for operation before making the adjustments.**



NOTICE:
Select C1 so that total capacity of 80pF is attained from the direction of the receiver jack.
Z: Output impedance of the S.S.G.

Fig. 18

• To Adjust

In case of MW (Select the band selector switch to MW)

SSG Frequency	Pointer Position	Adjustment	Note
1. 1,630 kHz (400 Hz, 30% modulation), output level 30 dB (μV)	Maximum	T7	1,630 kHz can be received
2. 515 kHz (400 Hz, 30% modulation), output level 30 dB (μV)	Minimum	VR1	515 kHz can be received
3. 600 kHz (400 Hz, 30% modulation), output level 30 dB (μV)	Tune to 600 kHz	T1, T4	mV meter maximum
4. 1,400 kHz (400 Hz, 30% modulation), output level 30 dB (μV)	Tune to 1,400 kHz	TC1, TC2	mV meter maximum
5. Repeat items (3) and (4) alternately so that the mV meter indicates maximum output.			

In case of LW (Select the band selector switch to LW)

SSG Frequency	Pointer Position	Adjustment	Note
1. 295 kHz (400 Hz, 30% modulation), output level 35 dB (μV)	Maximum	T8	295 kHz can be received
2. 145 kHz (400 Hz, 30% modulation), output level 35 dB (μV)	Minimum	VR2	145 kHz can be received
3. 215 kHz (400 Hz, 30% modulation), output level 35 dB (μV)	Tune to 215 kHz	T2, T3	mV meter maximum

3.9 DOLBY NR LAW ADJUSTMENT

• Connection Diagram

***Set the stereo unit for operation before making the adjustments.**

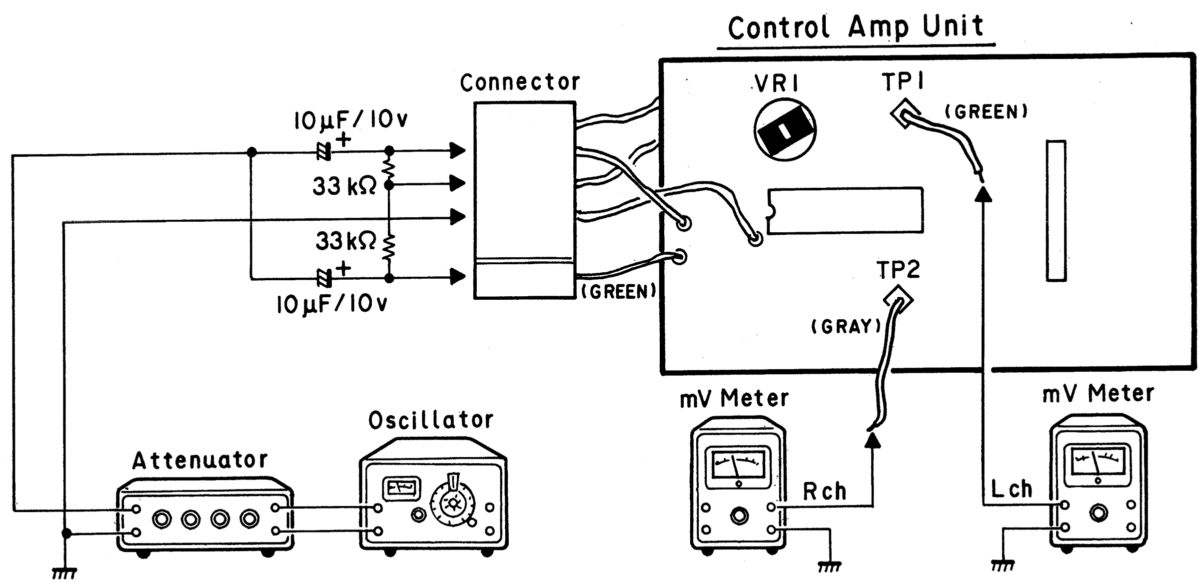


Fig. 19

• To Adjust

1. Load a cassette tape and set the unit to the playback mode.
2. Set the Dolby NR switch to OUT and apply a 5kHz input frequency signal from the oscillator. Adjust the attenuator so that mV meter pointer deflects to 58.7mV (−22.4dBs).
3. Now set the Dolby NR switch to IN and adjust VR1 so that mV meter pointer deflects to 23.4mV (−30.4dBs).

3.10 DOLBY NR LEVEL ADJUSTMENT

• Connection Diagram

***Set the stereo unit for operation before making the adjustments.**

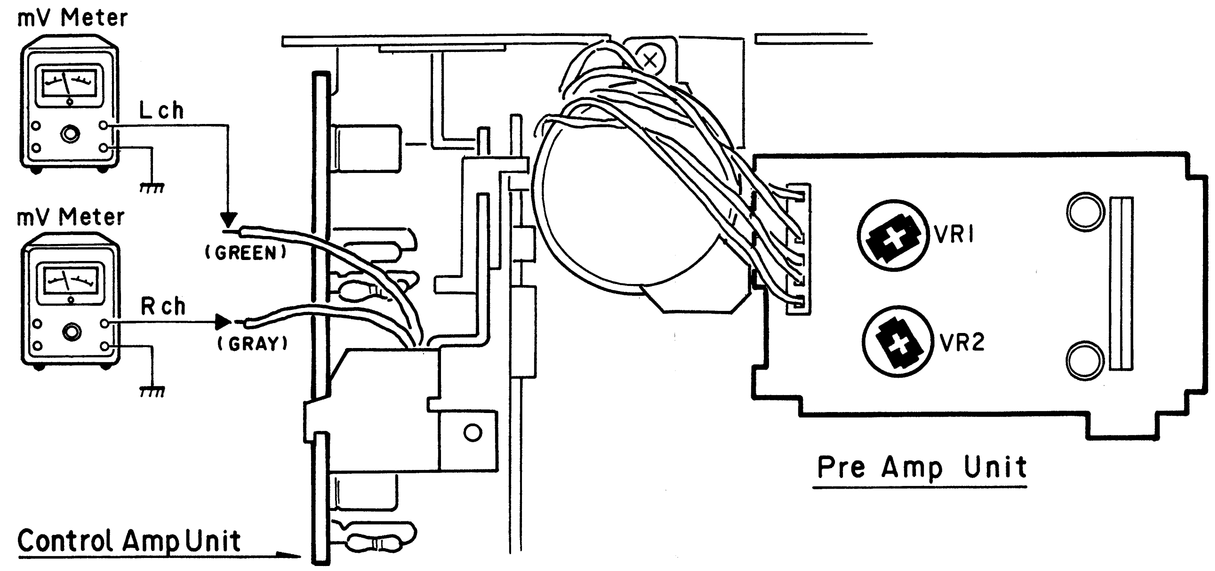

Fig. 20

• To Adjust

1. Play back the CT-150 (400Hz-200nwb/m) test tape and adjust VR1 (Lch) and VR2 (Rch) so that the mV meter pointer deflects to 775mV (0dBs).

11. PARTS LIST

NOTE:
When ordering resistors, first convert resistance values into code form as shown in the following examples.

Ex. 1 When there are 2 effective digits (any digit apart from 0), such as 560 ohm and 47k ohm (tolerance is shown by J = 5%, and K = 10%).

560Ω	*56 × 10¹*	*561*	*RD1/4PS [5][6][1] J*
47kΩ	*47 × 10³*	*473*	*RD1/4PS [4][7][3] J*
0.5Ω	*OR5*		*RN2H [0][R][5] K*
1Ω	*010*		*RS1P [0][1][0] K*

Ex. 2 When there are 3 effective digits (such as in high precision metal film resistors).

5.62 kΩ 562 × 10¹ .... RN1/4SR [5][6][2][1] F

- *Parts whose parts numbers are omitted are subject to being not supplied.*

61.		Connector
62.		Connector
63.		LED Array
64.	TLR-102	LED
65.	CSG-134	Switch
66.		Connector
67.	B08-204-A	Screw, M2×6
68.		Spacer
69.	LN43SYP	LED
70.	TLG-102	LED
71.	CEL-080	Lamp, 8V 60mA
72.		Holder
73.		Cover
74.	CXX-068	Display Unit
75.		Connector
76.	CDE-458	Cord
77.	E21-007	Fuse, 0.5A
78.	CDE-634	Cord
79.	CDE-636	Connector
80.	CDE-633	Connector
81.	CWG-071	Control Amp Unit

Packing Method

Key No.	Part No.	Description
1.	CRD-070	Owner's Manual (KEX-20)
	CRD-071	Owner's Manual (KEX-20)
	CRD-072	Owner's Manual (KEX-23)
	CRD-073	Owner's Manual (KEX-23)
2.	CEA-253	Holder Kit
2-1.	B10-875-A	BM4×6
2-2.	B20-038-A	OTW10ø×1.8t
3.	CHB-175	Styrofoam (1 set pair)
4.	E36-622	Polyethylene Bag
5.	CEA-314	Knob Kit
5-1.	CAA-313	Knob
5-2.	CAA-297	Knob
5-3.	CAA-298	Knob
6.	CEA-300	Accessory Kit
6-1.	CNC-975	Strap
6-2.	CDE-437	Cord
6-3.	CNV-769	Washer
6-4.	CEA-215	Screw Kit
6-4-1.	CBA-028	Screw for Strap
6-4-2.	B70-055-A	WN4ø×4.5t
6-4-3.	B20-013-A	SW4ø×1t
6-4-4.	B90-065-A	PSB5×16
6-4-5.	B70-056-A	WN5ø×5.3t
6-4-6.	CND-646	FW10ø×1t
6-4-7.	CBN-016	N10ø×3t
7.	CEA-312	Panel (KEX-20)
	CEA-313	Panel (KEX-23)
8.	CHB-577	Carton (KEX-20)
	CHB-579	Carton (KEX-23)
